The Supplemental Restraint System such as “AIR BAG” and “SEAT BELT PRE-TENSIONER” used along with a seat belt, helps to reduce the risk or severity of injury to the driver and front passenger for certain types of collision. The Supplemental Restraint System consists of a driver air bag module (located in the center of the steering wheel), front passenger air bag module (located on the instrument panel on passenger side), seat belt pre-tensioners, a diagnosis sensor unit, warning lamp, wiring harness and spiral cable.

WARNING:

- To avoid rendering the SRS inoperative, which could increase the risk of personal injury or death in the event of a collision which would result in air bag inflation, all maintenance should be performed by an authorized NISSAN dealer.
- Improper maintenance, including incorrect removal and installation of the SRS, can lead to personal injury caused by unintentional activation of the system.
- Do not use electrical test equipment on any circuit related to the SRS unless instructed to in this Service Manual. SRS wiring harnesses can be identified by yellow and/or orange harness connectors.

Precautions for Steering System

- Before disassembly, thoroughly clean the outside of the unit.
- Disassembly should be done in a clean work area. It is important to prevent the internal parts from becoming contaminated by dirt or other foreign matter.
- For easier and proper assembly, place disassembled parts in order on a parts rack.
- Use nylon cloths or paper towels to clean the parts; common shop rags can leave lint that might interfere with their operation.
- Before inspection or reassembly, carefully clean all parts with a general purpose, non-flammable solvent.
- Before assembly, apply a coat of recommended power steering fluid* to hydraulic parts. Petroleum jelly may be applied to O-rings and seals. Do not use any grease.
- Replace all gaskets, seals and O-rings. Avoid damaging O-rings, seals and gaskets during installation. Perform functional tests whenever designated.

*: Genuine NISSAN PSF II or equivalent. Refer to MA-13, “Fluids and Lubricants”.

PRECAUTIONS

Supplemental Restraint System (SRS) “AIR BAG” and “SEAT BELT PRE-TENSIONER”
## Special Service Tools

**POWER STEERING**

The actual shape of Kent-Moore tools may differ from those of special service tools illustrated here.

X: Applicable
Checking Steering Wheel Play

- Place wheels in straight ahead position and check steering wheel play.
  
  **Steering wheel play:**
  
  35 mm (1.38 in) or less

- If steering wheel play is not within specification, check the following for loose or worn components.
  
  a) Steering column. Refer to “STEERING COLUMN”, ST-12.
  
  b) Front suspension and axle. Refer to AX-4, “Front Axle Parts” and SU-6, “Front Suspension Parts”.

1. Steering wheel
2. Tilt mechanism (if equipped)
3. Steering gear assembly
4. Steering linkage
5. Power steering oil tank
6. Power steering oil pump
7. Steering column
ON-VEHICLE SERVICE

Checking Neutral Position on Steering Wheel

PRE-CHECKING
- Make sure that wheel alignment is correct.
  
  **Wheel alignment:**
  Refer to SU-18, “Wheel Alignment (Unladen *1)”.

- Verify that the steering gear is centered before removing the steering wheel.

CHECKING
1. Check that the steering wheel is in the neutral position when driving straight ahead.
2. If it is not in the neutral position, remove the steering wheel and reinstall it correctly.
3. If the neutral position is still not correct:
   a. Loosen tie-rod lock nuts.
   b. Move tie-rods, in opposite direction, the same amount on both left and right sides.
      This will compensate for error in the neutral position.

Checking Front Wheel Turning Angle
1. Rotate steering wheel fully right, then left; measure turning angle.
   
   **Turning angle of full turns:**
   Refer to SU-10, “Front Wheel Turning Angle”.

2. If it is not within specification, check stopper bolt adjustment. Refer to SU-10, “Front Wheel Turning Angle”.

Checking and Adjusting Drive Belts
Refer to MA-16, “Checking Drive Belts” (KA24DE) or MA-26, “Checking Drive Belts” (VG33E and VG33ER).
Checking Fluid Level

Check fluid level with engine off.
Check fluid level referring to the scale on the reservoir tank.
Use “HOT” range for fluid temperatures of 50 to 80°C (122 to 176°F). Use “COLD” range for fluid temperatures of 0 to 30°C (32 to 86°F).

CAUTION:
- Do not overfill.
- Recommended fluid is Genuine NISSAN PSF II or equivalent. Refer to MA-13, “Fluids and Lubricants”.

Checking Fluid Leakage

Check lines for improper attachment, leaks, cracks, damage, chafing and deterioration.
1. Run engine between idle speed and 1,000 rpm.
   - Make sure temperature of fluid in reservoir tank rises to 60 to 80°C (140 to 176°F).
2. Turn steering wheel right-to-left several times.
3. Hold steering wheel at each “lock” position for 5 seconds and carefully check for fluid leakage.

CAUTION:
Do not hold steering wheel at lock position for more than 15 seconds.
4. If fluid leakage from any line is noticed, loosen flare nut and then retighten.

Do not overtighten connector as this can damage O-ring, washer and connector.
5. If fluid leakage from power steering pump is noticed, check power steering pump. Refer to “Pre-disassembly Inspection”, ST-18.
6. If fluid leakage from power steering gear is noticed, check power steering gear. Refer to “Inspection and Adjustment”, ST-16.

Bleeding Hydraulic System

1. Raise front end of vehicle until wheels are clear of the ground.
2. Add fluid to reservoir tank to specified level. Quickly turn steering wheel fully to right and left and lightly touch steering stoppers.
   Repeat steering wheel operation until fluid level no longer decreases.
   Repeat step 2 above.
   - Incomplete air bleeding will cause the following to occur:
     a) Air bubbles in reservoir tank
     b) Clicking noise in power steering pump
     c) Excessive buzzing in power steering pump
When this happens, bleed air again.

Fluid noise may occur in the valve or power steering pump. This is common when the vehicle is stationary or while turning the steering wheel slowly. This does not affect the performance or durability of the system.

### Checking Steering Wheel Turning Force

1. Park vehicle on a level, dry surface and set parking brake.
2. Start engine and run at idle speed or 1,000 rpm.
3. Bring power steering fluid up to adequate operating temperature. [Make sure temperature of fluid is approximately 60 to 80°C (140 to 176°F).]

**Tires need to be inflated to normal pressure.**

4. Check steering wheel turning force when steering wheel has been turned 360° from neutral position.

- **Steering wheel turning force:**
  - 39 N (4 kg, 9 lb) or less

5. If steering wheel turning force is out of specification, check the following:
   c. Front suspension and axle. Refer to AX-4, “Front Axle Parts” and SU-6, “Front Suspension Parts”.
   d. Steering gear turning torque. Refer to “TURNING TORQUE MEASUREMENT”, ST-16.

### Checking Hydraulic System

Before starting, check belt tension, driving pulley and tire pressure.

2. Run engine at idle speed or 1,000 rpm.
   - Make sure fluid temperature in reservoir tank rises to 60 to 80°C (140 to 176°F).

**WARNING:**
Warm up engine with shut-off valve fully opened. If engine is started with shut-off valve closed, fluid pressure in the power steering pump increases to maximum. This will raise fluid temperature abnormally.

3. Check pressure with steering wheel fully turned to left and right positions while idling at 1,000 rpm.

**CAUTION:**
Do not hold the steering wheel at full lock position for more than 15 seconds.

- **Power steering pump maximum operating pressure:**
  - 7,551 - 8,336 kPa (77 - 85 kg/cm², 1,095 - 1,209 psi) at idle
  - If pressure reaches maximum operating pressure, system is OK.
If pressure increases above maximum operating pressure, check power steering pump flow control valve. Refer to “Components”, ST-18.

4. If power steering pressure is below the maximum operating pressure, slowly close shut-off valve and check pressure again.

**CAUTION:**
Do not close shut-off valve for more than 15 seconds.

- If pressure increases to maximum operating pressure, gear is damaged. Refer to “Removal and Installation”, ST-15.
- If pressure remains below maximum operating pressure, pump is damaged. Refer to “Components”, ST-18.

5. After checking hydraulic system, remove Tool and add fluid as necessary. Completely bleed air out of system. Refer to “Bleeding Hydraulic System”, ST-8.
Removal and Installation

STEERING WHEEL

1. Remove air bag module and spiral cable. Refer to RS-16, “Driver Air Bag Module and Spiral Cable”.
2. Disconnect horn connector and remove steering wheel nut.

3. Remove steering wheel using Tool.
   - For installation, refer to RS-16, “Driver Air Bag Module and Spiral Cable”.

ST-11
STEERING COLUMN
Removal

CAUTION:

- The rotation of the spiral cable (SRS “AIR BAG” component part) is limited. If the steering gear must be removed, set the front wheels in the straight-ahead direction. Do not rotate the steering column while the steering gear is removed.
- Remove the steering wheel before removing the steering lower joint to avoid damaging the SRS spiral cable. Refer to “STEERING WHEEL”, ST-11.

1. Remove steering wheel. Refer to “STEERING WHEEL”, ST-11.
2. Remove steering column covers.
3. Remove instrument lower panel. Disconnect security lamp indicator.
4. Disconnect combination switch electrical connectors and air bag harness connector.
5. Remove knee protector.
6. Disconnect ignition switch and shift lock solenoid connectors.
7. Disconnect shift cable.
8. Remove bolt from lower joint.
9. Remove two steering column bolts and remove steering column.

Installation

- When installing steering column, finger-tighten all lower bracket and clamp retaining bolts; then tighten them securely. Make sure that undue stress is not applied to steering column.
- When fitting steering lower joint, be sure tightening bolt faces cutout portion.
- Align spiral cable correctly when installing steering wheel. Refer to RS-16, “REMOVAL AND INSTALLATION”.

CAUTION:
After installation, turn steering wheel to make sure it moves smoothly. Ensure the number of turns from the straight forward position to left and right locks are the same. Be sure that the steering wheel is in a neutral position when driving straight ahead.
1. Steering column shaft
2. Steering column upper shaft
3. Tilt mechanism (Do not disassemble)
4. Lower tube assembly
5. Bellows
6. Steering column lower shaft

- When disassembling and assembling, unlock steering lock with key.
- Install lock nut on steering column shaft and tighten the nut to specification.
  \[ 25 - 34 \text{ N-m (2.5 - 3.5 kg-m, 18 - 25 ft. lb)} \]

- Steering lock
  a) Break self-shear type screws using a drill or other appropriate tool.
b) Install self-shear type screws, then tighten until heads break off.

**Inspection**

- If steering wheel does not turn smoothly, check the steering column as follows and replace damaged parts.
  
  a) Check column bearings for damage and unevenness. Lubricate with recommended multi-purpose grease or replace steering column as an assembly, if necessary.
  
  b) Check jacket tube for deformation and breakage. Replace if necessary.
  
- If the vehicle is involved in a light collision, check dimension “L”. If it is not within specification, replace steering column as an assembly.

  **Column length “L”:**
  
  863.1 - 864.7 mm (33.980 - 34.043 in)

**TILT MECHANISM**

After installing steering column, check tilt mechanism operation.
Description

1. Power steering oil tank  
2. High pressure hose  
3. Power steering oil pump  
4. Steering gear  
5. Low pressure hose

CAUTION:
- Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.
- Disassemble in as clean a place as possible.
- Clean your hands before disassembly.
- Do not use rags; use nylon cloths or paper towels.
- Follow the procedures and cautions indicated in the Service Manual.

Removal and Installation
Before removal, clean gear housing and oil pump exteriors using a steam cleaner, then dry with compressed air.
Inspection and Adjustment

Before replacing power steering, make sure there is no oil leakage around sealing portion and check steering turning torque as follows:

Check sealing portion.
- Sector shaft cover O-ring
- Sector shaft U-packing
- Sector shaft oil seal
- Rear housing O-ring
- Gear housing O-ring

TURNING TORQUE MEASUREMENT

1. Measure turning torque at 360° position.
   a. Install steering gear on Tool.
   b. Turn stub shaft all the way to right and left several times.
   c. Measure turning torque at 360° position from straight-ahead position with Tools.

   **Turning torque at 360°:**
   - 0.20 - 0.90 N·m (2.0 - 9.2 kg-cm, 1.8 - 8.0 in-lb)
d. Measure turning torque at straight-ahead position.

Straight-ahead position is a position where stub shaft is turned 1.93 turns (two full turns and 50°) from lock position.

Turning torque at straight-ahead position:
- 0.45 - 0.80 N·m (4.6 - 8.2 kg-cm, 4.0 - 7.1 in-lb)
- higher than turning torque at 360°

Maximum turning torque:
- 1.7 N·m (17.3 kg-cm, 15.0 in-lb)

If turning torque is not within specifications, adjust by turning sector shaft adjusting screw.

2. Tighten adjusting screw lock nut with tools.
Pre-disassembly Inspection
Disassemble the power steering oil pump only if the following items are found.
- Oil leak from any point shown in the figure.
- Deformed or damaged pulley.
- Poor performance.

Disassembly

**CAUTION:**
- Parts which can be disassembled are strictly limited. Never disassemble parts other than those specified.
- Disassemble in as clean a place as possible.
- Clean your hands before disassembly.
- Do not use rags; use nylon cloth or paper towels.
- When disassembling and reassembling, do not let foreign matter enter or contact the parts.
Remove snap ring, then draw drive shaft out.
- Be careful not to drop drive shaft.

- Remove oil seal.
- Be careful not to damage front housing.

- Remove connector and flow control valve with spring.
- Be careful not to drop flow control valve.

**Inspection**
- If pulley is cracked or deformed, replace it.
- If fluid leak is found around the pulley shaft, replace the oil seal.

**Assembly**
Assemble oil pump, noting the following instructions.
- Make sure O-rings and oil seal are properly installed.
- Always install new O-rings and oil seal.
- Be careful of oil seal direction.
- Cam ring, rotor and vanes must be replaced as a set if necessary.
- When assembling, coat each part with Genuine NISSAN PSF II or equivalent.
- Pay attention to the direction of rotor.

- When assembling vanes to rotor, rounded surfaces of vanes must face cam ring side.

- Insert pin 2 into pin groove 1 of front housing and front side plate. Then install cam ring 3 as shown at left.

  Cam ring:
  
  $D_1$ is less than $D_2$
Removal and Installation

Remove pitman arm with Tool.

Remove tie-rod from knuckle arm with Tool.
### IDLER ARM ASSEMBLY
- Apply coat of multi-purpose grease to bushing.
- Press bushing into idler body, and insert shaft of idler bracket carefully until bushing protrudes.

### CROSS ROD AND TIE-ROD
1. When tie-rod ball joints and tie-rod bar are separated, adjust tie-rod length correctly. Adjustment should be done between ball stud centers.
2. Lock tie-rod clamp nut so that ball joint on outer ball stud is as follows with respect to that on inner ball stud.
   - **L**: Standard dimension before toe-in adjustment
     - 2WD and 4WD: 297.6 mm (11.72 in)

**CAUTION:**
Make sure that tie-rod bars are screwed into tie-rod tube more than 22 mm (0.87 in) 2WD and 4WD.
Inspection

BALL JOINT AND SWIVEL JOINT

1. Check joints for play. If ball or swivel stud is worn and play in axial direction is excessive, or joint is hard to swing, replace as a complete unit.

   - **Swinging force (Measure point: Cotter pin hole) “A”**:  
     - Ball joint  
       15.7 - 147.1 N (1.6 - 15.0 kg, 3.5 - 33.1 lb)  
     - Rotating torque “B”:
       - Ball joint  
         0.5 - 4.9 N·m (5 - 50 kg-cm, 4.3 - 43.4 in-lb)  
       - Swivel joint  
         1.0 - 5.9 N·m (10 - 60 kg-cm, 8.7 - 52.1 in-lb)  

   - **Axial end play “C”**:  
     - Ball joint and swivel joint  
       0 mm (0 in)

2. Check condition of dust cover. If it is cracked excessively, replace as a complete unit.

**CAUTION:**

Be careful not to apply grease or oil to taper of joint.

IDLER ARM ASSEMBLY

- Check rubber bushing of idler arm for breakage, wear or play, and if necessary replace.
- Lubricate idler arm assembly with multi-purpose grease, if necessary.

CROSS ROD AND TIE-ROD

Check tie-rod and cross rod for breakage, bends and cracks, and replace with a new one if necessary.

FIXING LOCATION

- Check fixing location (nuts and cotter pins) for looseness, play or breakage.
- When looseness or play is found, check for wear on tapered portion of joints, gear arm or idler arm.
- When reassembling each joint, use new cotter pins.
